

These wireframes are for my website that will discuss endangered animals and their conservation or endangered status. I will use datasets from ICUN or other credible sources that talk about animals and their population based on country. The circle in the middle depicts a 3d globe (or an svg if the 3D model does not work out). The viewer can click on different countries and see their stats and information appear on the side. I intend to use 3js to insert the 3d model and use other JavaScript animations to make the website more complex and smooth.
